PING ERROR TEST

Explain proper scenario for following ping errors ?

Destination host unreachable

Sent by a router along the path when it has no route to the destination network in its table - the router drops the packet and sends this ICMP message back to the source. This means the problem is a missing route somewhere in the middle of the path, not at the source.

Request timed out

Source sent the ping but got no reply back within the timeout window. Usually means the destination (or a device on the path) is silently dropping ICMP - like a firewall blocking ping - or the path is too slow/congested. Unlike destination unreachable, no error is sent back at all, just silence.

Reply from some ip destination host unreachable

Same as destination unreachable, but this time the message shows the IP of the specific router that couldn't forward the packet, not the source or final destination. Tells you exactly which hop along the path is missing the route.

TTL expired

Packet's TTL counted down to 0 before reaching the destination. Usually caused by a routing loop (packet keeps bouncing between routers) or the destination being farther away (more hops) than the starting TTL value allowed.
